

# Ladder Process on Netzer

The upcoming Release 1.5 will have support for custom computations and serial drivers directly executed on Netzer. The chosen programming dialect is [Ladder\\_logic](#). The IDE for programming will be [ldmicro](#). This article will cover the progress of the implementations. The final feature set is not completed yet.

## Netzer memory organization

### Runtime image

Runtime images are actually interpreted.

The interpreter is entirely written in Assembler for runtime issues.

The reasons for interpretation:

- Easier implementation
- Smaller runtime images
- Security issues (images can be uploaded via Netzer webpage).
- The images can be stored anywhere beyond flash also EEPROM, SD card or SRAM would be possible.

At the moment, the runtime image is stored in a 2K flash memory area in the bootloader. The interpreter images stay persistent even during firmware updates. The syntax (opcodes and parameters) is adopted from [ldmicro](#) but is optimized for space and runtime issues.

The translation from [ldmicro](#) interpreter code to Netzer opcode files is done via free available IDE extension from MoBaCon (see below).

The translator also integrates some meta data (project name, modification date, found opcodes, ...) which is displayed on Netzer web interface after upload.

The prepared image can be uploaded via Netzer web interface or with command line tools like **curl**. For custom implementations a preloaded image can be integrated in the firmware image.

After loading or when restarting Netzer the image is always checked for validness and consistency.

### Register areas (PABs)

Adopted from [ldmicro](#) the runtime knows about two data types: boolean (Width: Bit) and signed integer (width: 16 bit).

There are two different register areas (called PAB): common PAB and IO PAB.

## Common PAB

This PAB is a real SRAM area in the Netzer space. The size is 256 bytes. Therefore 128 integer or 2048 bit variables can be stored. The common PAB is used as scratch area. The process has exclusive access, no other Netzer software module can change the common PAB. Integer and bit variables share the same address area.

## IO PAB

This PAB is a virtual SRAM area. The IO PAB is divided into integer and bit variables area. Unlike in common PAB integer and bit variables do not share the same address area. For communication between bit and integer areas a copying via the common PAB can be used.

## Command interface

For communication between the command interface and the process a special SRAM area is introduced. There are 8 integers available in each direction (address 0x10-0x17).

*Receiving data from command interface* Each time the command interface writes new data, the corresponding mailbox flag in the bit area is set. The process program can poll for this flag and read the value afterwards. Reading clears the flag automatically.

*Sending data to command interface* Writing to one of the integers sends data to the command interface. Afterwards the mailbox flag is set automatically. After the command interface has fetched the data, the mailbox flag is cleared. The process should poll mailbox flags to prevent data loss.

## Bit variables

Address	Access	Function	Address	Access	Function
0x00	RW	IO0 latch pin	0x80	RO	IO0 port pin
0x01	RW	IO1 latch pin	0x81	RO	IO1 port pin
0x02	RW	IO2 latch pin	0x82	RO	IO2 port pin
0x03	RW	IO3 latch pin	0x83	RO	IO3 port pin
0x04	RW	IO4 latch pin	0x84	RO	IO4 port pin
0x05	RW	IO5 latch pin	0x85	RO	IO5 port pin
0x06	RW	TX latch pin	0x86	RO	TX port pin
0x07	RW	RX latch pin	0x87	RO	RX port pin
0x08	RW	SPI_CS latch pin	0x88	RO	SPI_CS port pin
0x09	RW	SPI_INT latch pin	0x89	RO	SPI_INT port pin
0x0A	RW	SPI_CLK latch pin	0x8A	RO	SPI_CLK port pin
0x0B	RW	SPI_MI latch pin	0x8B	RO	SPI_MI port pin
0x0C	RW	SPI_MO latch pin	0x8C	RO	SPI_MO port pin
			0x8D	RO	Serial TX FiFo ready
			0x8E	RO	Serial RX FiFo data pending
			0x8F	RO	Reserved

Address	Access	Function	Address	Access	Function
			0x90-0x97	RO	Mailbox state for incoming command interface variables
			0x98-0x9F	RO	Mailbox state for outgoing command interface variables

### Integer variables

Address	Access	Function
0x00	RW	Latch - All IO port latches in one integer (IO0 is at bit 0 and so on)
0x01	RW	Edge counter (measured at IO0)
0x02	RW	Edge counter (measured at IO1)
0x03	RW	Edge counter (measured at IO2)
0x04	RW	PWM duty cycle / Impulse width (IO3)
0x05	RW	PWM duty cycle / Impulse width (SPI_INT)
0x06	RW	Top of serial FiFo (Reading: RX, Writing: TX)
0x07	RW	Accessing top of net socket FiFo (Reading: RX, Writing: TX)
0x10-0x17	RW	Command interface variables
0x80	RO	Process scratch register. After a division here the modulo result can be found.
0x81	RO	Ports - All IO port pins in one integer (IO0 is at bit 0 and so on)
0x82	RO	ADC (IO4) - Measured value as 10 Bit value
0x83	RO	ADC (IO5) - Measured value as 10 Bit value
0x84	RO	RTC Seconds
0x85	RO	RTC Minutes
0x86	RO	RTC Hours
0x87	RO	RTC Day of the Week
0x88	RO	RTC Day
0x89	RO	RTC Month
0x8A	RO	RTC Year

## IDE

[Download the IDE](#)

Actually all the features of the IDE which can be compiled into interpretable code can be used.

The ADC PWM and UART stuff is not supported by Idmicro for interpreter targets - but that is no problem because the Netzer solves this via its IO register set.

For that reason a simple naming convention must be considered.

## IO PAB Mapping

Bit variables and integer variables can be mapped directly to IO PAB integer using the @ operator.

To locate integer variable adc to the IO location of ADC 4 for example simply rename it to adc@01.

To which PAB area (bit or integer) the operator finally maps depends on the variable type.
